Vibro – I

2007-10-02

Past week

- We made a table for the business plan and decided a hierarchical order for the group members. We gave the individual responsibilities to each member.
- Members thought about the individual responsibilities and tasks of themselves. We thought about how to do the product and the necessary equipment at the beginning; made the schedule and discussed missing parts if there was any.
- The problem was to decide who is going to do what exactly. Each member told, in which part of the project they want to help the others without their own responsibility, without the part of their profession, if necessary.
For example, writing the business plan is the job of IE students in our group, but we decided not to give all responsibility to them. Therefore some of us helped them as possible as it is going to be for other parts of the project.

Next week

- We are going to start to do the project as it was written in the business plan. First we need to design the product, so we can decide what we need to get.
- Each member is going to start from some point of their individual work. So we can see how it can be done beter.
We are going to check whether the plan is working or not and if it is necessary we are going to make some changes. We are going to decide all the equipment to buy and start the hardware part of the product. In addition, we are planning to decide which programming languages and IDEs to use for our project.
- The problem can be making wrong decissions at the beginning of the work. To measure doing lots of mistakes, it is better to start with a small part of the project to test it by iteratively. It helps us to see what we need exactly.
