VIBRO-I

Due Date:

25.03.2008

Past Week's Accomplishments:

- We discussed how we could attract the traders to make them buy our shares.
- We got an appointment from digital image laboratory in order to fix our cameras whose focuses are at the same direction. (We have to make both cameras focus on a straight line and both attaching to the board parallel to each other.)
- We'd begun to present our product to traders and with new ways we've been attracting the traders.
- We continued to work on the object detection software to obtain a development about the pre-defined objects as we have been doing for some time.
- We also continued to work on the sensors in order to make them more functional than the functionality of the sensors we have now.

Next Week's Planned Activities:

- We will define the starting objects, which are cars and human bodies.
We will test the camera-detecting part of our project. If we will succeed on this first test, it would be a great advantage for us to attracting the traders with our prototype.
- We will continue to present our project to traders to attract them
