VIBRO-I

Due Date:

08.04.2008

Past Week's Accomplishments:

- Expected demo of our work as a working circuit is completed by our EE members. In this circuit we connected three sensors to the suitable arranged circuit and three vibration devices vibrate according to the coming obstacle and its direction.
- We worked on the demonstration presentation for this week.
- We tried to find a 300m range sensible sensors, but the representer company of the product said that it could not be supplied for Turkey by our company. We will continue to make some researches to find that sensor.
- We learnt some useful circuit construction technique to get rid of the delays.

Next Week's Planned Activities:

- We will find a wireless connection device appropriate to our project which can manage both the sensors and vibration devices at the same time and make the connection between them.
- We will made some searches in order to find an efficient sensor which can work in three dimensions and can sense through one meter efficiently.
- We have adapted our economical expectations and calculations according to the new decided devices.
